An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998). This clone is in a modified pBluescript vector as a SstI/XhoI insert. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further details.

The library was prepared using the Stratagene pBluescript II SK(+) library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a synthesized from mRNA using a primer consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DHIOB host cells, Plant material was provided by Michael G. Hahn (Complex Carbohydrate Research Center, University of Georgia) and the library was constructed by Anu Khanna (Lila Vodkin lab 11 c 123 g 181 t

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998). cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                               3-1-1 Koyadai, Tsukuba, Ibaraki 305-0074, Tel: 81-298-36-4359

XhoI; The mRNA was isolated from roots of Glycine max
'Supernod' plants generously donated by Dr. Gary Stacey.
The seedlings were innoculated with Bradyrhizobium
japonicus; strain USDAILO priot to harvest. Stratagene's
cDNA synthesis Kit (Cattalog number 200401) was used to
synthesize the cDNA. First-strand synthesis was performed
with 5-methyl dCTP, hence the ligated cDNA was
hemimethylated, A modification of Stratagene's
first-strand synthesis primer was used. An 'anchor'
nucleotide (vA,C, or G) was added to the 3' end of the
primer [GAGAGAGAGAGAGAGACACTACTCTCGAG(T)180] to anchor
the primer at the 5' end of the poly(A) tract. After
second-strand synthesis, the cDNA ends were filled in with
cloned pfu DNA polymerase, ligated to EcoRI adapters and
subsequently phosphorylated. The XhoI site within the
first-strand synthesis primer was then restricted by
digestion with XhoI; all XhoI sites in the CDNA would be
protected by their hemimethylated status. The cDNA
constructs were size-fractionated with a 500bp cutoff,
using GlocoBRI Life Technologies' cDNA Size Fractionation
column. The column eluent was then ligated into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Nucleotide sequences of Dictyostelium discoideum developmentally
regulated cDNAs rich in (AAC) imply proteins that contain clusters of
asparagine, glutamine, or threonine.";

Mol. Gen. Genet. 218:453-459(1999).

1-1 DEVELOPMENTAL STAGE: THE CONCENTRATION OF AAC-RICH MRNAS IS LOW
IN DORMANT SPORES AND GROWING CELLS, BUT INCREASES DURING
SPORE-GERMINATION AND MULTICELLCHAR DEVELOPMENT.

1-1 MISCELLANEOUS: SEVERAL PROTEINS DERIVE FROM AAC-RICH MRNA, WHICH,
DUE TO A FRAMESHITT ALSO HAVE ACA AND CAA CODONS AND THUS ARE
ASN-, THR- OR GLN-RICH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              InterPro; IPR000637; AT_hook.

*A phosphatidylinositol (PI) kinase gene family in Dictyostelium discoideum: biological roles of putative mammalian pl10 and yeast Vps34p Pl 3-kinase homologs during growth and development.";
MOI. Cell. Biol. 15:5645-5656(1995).
-i- CATALYTIC ACTIVITY: ATP + 1-phosphatidyl-1D-myo-inositol = AI
1-phosphatidyl-1D-myo-inositol 3-phosphate.
-i- SIMILARITY: BELONGS TO THE PI3/P14-KINASES FAMILY.
